

Finishing

The Finishing process refers to all processes to be applied to the product as soon as it comes off the paper machine. These processes include: winding, sheeting, embossing, wrapping, and packing.

Winding

Winding is the process of converting paper from large paper machine rolls into smaller reels of a more useable size. The smaller reels are then either sent direct to the customer or processed by the sheeter or the Embosser. Customers for paper in reel form include large printing companies.

Embossing

Embossing is the process of pressing a pattern into the surface of paper to enhance the visual impact and texture of the paper. These products are typically used for business cards, annual reports, menus, and for general high quality printing where a distinctive look and feel is required.

Sheeting

Sheeting is the process of converting paper from reels into sheets. Many of the products from the Shoalhaven Paper Mill are used by commercial printers to make cards, calendars, annual reports etc. As such the sheets are produced in many different sizes to suit the specific printing job.

Folio/Lenox

These processes pack stacks of paper into a paper wrapper including A4. The wrapper helps protect the paper from transport and storage damage. The wrapper is made from paper that has been coated with a film of polyethylene. This provides a moisture barrier and maintains the moisture content of the paper at the required level.
